AWS STORAGE ASSIGNMENT

Name: Meet Kalal

Subject: Amazon Web Services (AWS)

Topic: S3, EBS and Glacier

Q.1. Create a new S3 bucket in AWS with a unique name and select the Asia Pacific (Mumbai) region.

Answer: I will sign in to the AWS Management Console and open the Amazon S3 service. I will click on Create bucket and enter a unique bucket name, for example **meetkalal-s3-20261102**. After that, I will select **Asia Pacific (Mumbai) – ap-south-1** as the AWS Region and keep the default settings. Finally, I will click on Create bucket to create the bucket.

Q.2. Upload three different files (an image, a PDF and a text file) to the S3 bucket with meaningful names.

Answer: I will open my newly created S3 bucket and click on Upload, then Add files. I will select the following files from my computer and upload them:

File Type	File Name
Image	instagram-profile-icon.png
PDF	spotify-playlist.pdf
Text File	zomato-menu.txt

After selecting the files, I will click on Upload. The three files will then be visible in the Objects section of my S3 bucket.

Q.3. Make one uploaded file publicly accessible and test its URL in a browser.

Answer: I will select the image file **instagram-profile-icon.png** from the bucket and open its Permissions section. I will use the available public access setting as required for the practical. Then I will copy the Object URL and open it in a web browser. If the image opens without asking for AWS login, it means the public URL is working. Public access should only be enabled for a sample file that does not contain private information.

Q.4. Enable versioning on the S3 bucket and upload a new version of one file.

Answer: I will open the Properties tab of my S3 bucket and find the Bucket Versioning option. I will click Edit, select Enable and save the changes. Next, I will update the content of **zomato-menu.txt** and upload it again using the same file name. After uploading, I will select Show versions in the Objects section. The old and new versions of the file should be displayed with separate Version IDs.

Q.5. Explain the main differences between AWS S3, EBS and Glacier. Also mention which service is suitable for the given examples.

Answer: Amazon S3 is an object storage service used to store files such as images, documents and backups. Amazon EBS is block storage that works like a hard disk for an EC2 instance and is commonly used for operating systems and databases. S3 Glacier is used for low-cost, long-term storage of data that is not accessed frequently. I would use S3 for Instagram profile pictures and frequently accessed Flipkart order-history files, while I would use S3 Glacier for old IRCTC booking records that need to be stored for a long time but are rarely accessed.

Conclusion: AWS provides different storage services for different requirements. S3 is suitable for frequently accessed objects, EBS is suitable for EC2 disk storage, and Glacier is suitable for long-term archival data.
